ResaleRadar

Snap a photo. Know what it sells for before you list it.

Amazon Aurora PostgreSQL + pgvector

► resaleradar.vercel.app · github.com/manojmallick/resaleradar

THE PROBLEM

Why this is hard

Resellers price by guessing. Underprice → lost money. Overprice → it never sells.

No tool tells you what an item is really worth across eBay, Poshmark & Depop at once —

or how fast it will actually sell.

THE SOLUTION

How it works

1. **Snap**
   Photo → Bedrock Claude vision identifies brand, model & condition.

2. **Value**
   The photo is embedded (Titan multimodal) and matched against sold comps via pgvector.

3. **List**
   Velocity-ranked price ($/day, not just median) + an auto-generated listing.

ARCHITECTURE

End to end

Next.js UI
Vercel

→

/api/identify
Bedrock Claude vision

→

/api/value
pgvector kNN + velocity SQL

→

Aurora PostgreSQL
pgvector · vector(1024)

WHY AMAZON AURORA POSTGRESQL

Relational price comps + visual-similarity vector search in ONE Aurora query — no separate vector DB.

TECH & DIFFERENTIATION

Built with

Next.js 16 | TypeScript | Tailwind | Aurora PostgreSQL | pgvector | Bedrock Titan + Claude | Vercel

WHY THIS DATABASE

Relational price comps + visual-similarity vector search in ONE Aurora query — no separate vector DB.

THE EDGE

Days-to-sell velocity (rank by $/day, not highest median) + honest data (live eBay vs. labeled estimates).

TRACTION

Live & shippable

Free · Pro $9/mo · Business $29/mo + 1% on sales. $250B resale market, growing 15%/yr.
